

ABSTRACT:

A back lighting system for illuminating a display device comprises a light-emitting panel (1) and a light source (6) for coupling light into the light-emitting panel (1). The light source comprises a low-pressure discharge lamp (6; 7). According to the invention, the light source additionally comprises a plurality of LEDs (8, 8', ..., 9, 9', ...) for selectively
5 setting the color temperature of the light emitted by the light source. Preferably, the LEDs (8, 8', ..., 9, 9', ...) increase the color temperature of the light emitted by the light source. Preferably, the light emitted by the back lighting system ranges from 6,000 to 10,500 K. Preferably, the LEDs (8, 8', ..., 9, 9', ...) are blue light emitting LEDs, each preferably having
10 a luminous flux of at least 5 lm. The color point of an image to be displayed on a display screen of the display device is set by the back lighting system, thus enabling an optimum contrast to be achieved for the image to be displayed by the display device.
